How to type accents

Typing accents depends on the platform you're using. For more information see here: <http://sites.psu.edu/symbolcodes/>

Windows

You can bring up the **Character Map** utility and select the accented characters to copy and paste into your Fade In document. Alternately, you can use predefined key combinations such as **Ctrl+'** then the **E** key to type "é", or you can type character codes directly using **Alt+0nnn**, where nnn is the numeric code as per <http://sites.psu.edu/symbolcodes/windows/codealt/>.

See Microsoft's [Keyboard Shortcuts For International Characters](#) for more details. (Note that not all key combinations may be supported by Fade In, and/or some combinations may conflict with default or user-defined shortcut keys.)

Mac

Use the **Keyboard and Character Viewer** from **Language & Text** preferences to find the accented characters you want. You can alternately type the characters directly using the **Option+<letter>** key combination for a particular character. Note that some accents are produced using a two-keystroke combination. For instance, to type an "ñ", you would first type **Option+N** (to indicate a tilde ("~")), then **N** again. To type "ö", you would type **Option+N**, then **O**. To type "é", first type **Option+E** (for "'"), then **E**. More combinations are here: <http://sites.psu.edu/symbolcodes/mac/codemac/>

Linux

Depending on your distribution, you may have a character map or equivalent utility, that you can use to find and copy/paste the desired characters into your Fade In document. Depending on your keyboard layout, you may be able to use some Windows-style predefined key combinations, as indicated above, and/or you may be able to use **Compose** key (sometimes called **AltGr**) combinations as described [here](#).
